Thanks for the excellant documentation of the China fire burn rehab
survey needs. Because the size _ \$ amount did not quite qualify for
emergency funding, your efforts of following through with the needed
treatments with district financing are commendable.
Keep up the good work.

This message is to inform you that the Hayfork District conducted an
Emergency Burn Area survey of the China Fire (fire no. SHF-5152)
which started on 9/6/91. An interdisciplinary team consisted of
Watershed Specialists, a Fisheries Biologist, and a Wildlife
Biologist. The total acreage of the China Fire was 409 acres. The
survey team found approximately 60% of the area had burned hot, and
40% had burned with low intensity. Of the 60% that burned hot,
approximately 100 acres was a Chamise/Manzanita brush field. The
remainder was Douglas Fir/Pine mix. The ID team felt that the
Chamise would resprout and provide the necessary ground cover and
that the conifer forest would be salvage logged creating slash for

ground cover. There are no plans for site prep following salvage logging. There are needs to construct approximately 40 low tech check
