Subject: Burned Area Report - Westberry Fire

To: Regional Forester, R-2

Attached for your consideration is the final "Burned Area Survey Report" and request for emergency rehabilitation funds. Seed mixture and rate of application as discussed with Dave Smith are acceptable.

WEST BERRY TRAILS FIRE Black Hills National Forest

The West Berry Trails Fire is located in Sections 35 & 36, Township 2 North, Range 6 East, Section 31, Township 2 North, Range 7 East, Sections 5,6,7,8 & 18, Township 1 North, Range 7 East, Sections 1,2,3,12 & 13, Township 1 North, Range 6 East, BHM. See the attached map. The fire was man caused.

The area is within the Steeply Dipping Plateau Lands Landtype Association. They are characterized as having broad, open, grassy ridgetops, narrow valleys and steep to very steep sideslopes. Dissection is strong. Sandstone, limestone and shale outcrops can be found throughout the area. Dominant soils are Vanocker and Hilger. Ponderosa pine, western wheatgrass, green needlegrass, leadplant and big & little bluestem are the dominant plant species found throughout the area.

The fire burned approximately 800 acres of National Forest land and 3000 acres of private lands.

High, moderate and low intensity burns are fairly evenly distributed throughout the burned area. Approximately 460 acres on National Forest land and 530 acres of private lands are in the high intensity category. The high intensity burned areas are confined mainly to slopes 30% and steeper. 210 acres of National Forest and 1920 acres of private lands are in the moderate category. The remaining 130 acres on National Forest and 550 acres on private lands burned with a low intensity.

Visual aesthetics are crucial to the area. The burn is adjacent to Rapid City, SD, the major city in the Black Hills area. Much of the burned area is visable from the city. The private lands within and adjacent to the burned area contain numerous dwellings and single family housing developments. Concern has already been expressed by the public to "green-up" the burned area as soon as possible on both the NFS lands and private lands within the burn.

The proposed rehabilitation plan includes seeding 460 acres of NFS land that burned with a high intensity. The steep to very steep sideslopes have little or no effective ground cover remaining to reduce soil erosion. In addition, 8 channel stabilization structures will be installed to reduce channel scouring and deposition of sediments, ash and charcoal on downstream private lands.

The seed mixture proposed to be used follows:

pubescent wheatgrass 5 lbs/ac intermediate wheatgrass 5 lbs/ac timothy 1 lb/ac alsike clover 1 lb/ac annual ryegrass 5 lbs/ac

Channel stabilization structures consist of straw bales held in place by steel posts or heavy rebar and reinforced with rock where necessary.

The same recommendations apply for private lands within the burned area.

- 1. Canyon Lake is downstream. Even though sediment can reduce the capacity of the reservoir, the amount of usable water for the Rapid City water supply is not expected to be significantly reduced.
- 2. Sediment delivery is estimated at 15% errosion rate. Sediment removal cost is \$15.00/yd.
- 3. Fish habitat is not expected to be significantly reduced except by sediment. Sediment removal cost is reflected in I-2.
- 4. Water treatment costs are not expected to increase since infiltration galleries are below Canyon Lake, which will trap most of the sediment.
- 5. Major flooding is not expected to occur because of the relatively small watershed areas affected.
- Range RPA value for Black Hills is \$14.35/AUM. Limited grazing will occur for 3 years without treatment, 2 years with treatment.
- 7. No change in wildlife, recreation or timber expected with or without treatment.
- 8. Lost soil fertility estimated at \$6.00 per ton soil lost.

| 12. Narrative (Optional- if additional space is needed, attach another sheet).
| The watersheds involved are within the Rapid Creek watershed. Rapid creek provides domestic use | water to Rapid City, population about 50,000. The size of the affected watersheds on NFS lands | is about 2 sq. mi. Should the design storm occur and no treatment is done, the additional amount | of flooding (over that expected form pre-fire conditions) is insignificant. Therefore no | estimated values for lines 1, 2, 4, 5, 6, 7, 8 and 9 are included. Costs of sediment removal and | effects on recreation in fish habitat are addressed on form 2500-8a.

Hazards from floods, floating debris, erosion, or sediment because a watershed is impaired by wildfire. (Do not include value of resources damaged or destroyed by the fire reported on FS-5100-29.)

 $^{^{\}rm 2}$ Indicates values threatened by design storm. Does not enter into the B/C.
