BURNED AREA REPORT (Reference FSH 2509.13, Report FS-2500-A)

PART I - TYPE OF REQUEST

1.	Type of Report
	[] A. Funding (Request for estimated FFF funds) [X] B. Accomplishment Report
2.	Type of Action
	[] A. Initial (estimated funding is first requested) [] B. Interim
	[] Updating the initial funding request. [] Supplying information for accomplishments to date on emergency work underway. [X] Compliant
	[] Best estimate for funds needed to complete eligible rehabilitation measure.
	[X] Following completion of funded work.
	PART II - FIRE LOCATION
1.	Fire Name (from Form FS-5100-29), poce Total
2.	Forest Supervisor's Fire No. (from Form FS-5100-29): P37409
3.	State: ARIZONA
4.	County: YAVAPAI
5.	Region: 03
Ś.	Forest: PRESCOTT
7 -	Ranger District: 03
3.	Date Fire Started: 6/13/90
€.	Date Fire Controlled: 6/16/90
٥.	Estimated Suppression Costs: \$380,000
١.,	Fire Suppression Damages Repaired with FFF 102 Funds: \$ 2,500
	0.50 miles (firelines waterbarred)
	2 acres (firelines seeded)
	other: heliport, road to DP 1,
	roads and facilities at Buckman Camp
2.	Fire Intensity: 20 % (low) % (medium) 80 % (high)
	PART III - NATIONAL FOREST SYSTEM PROBLEM INVENTORY

- 1. Watershed No.: 1503020320 and 1506020183
- 2. NFS Acres Burned: 853
- 3. Water Repellant Soil: 40 % of NFS acres burned

				.9 .	e, .
4.	Vegetation Types: Chaparrel w/ woodland and ponderosa pine in drainages				
5.	Geologic Types: granite				
6.	Soil Erosion Hazard Rating:				
	% (low) 40 % (medium) 60 % (high)				
	[10 to 30% slopes] [> 30% slopes]				
7.	Erosion Potential: (est) 33.0 tons / acre.

DOCE FIRE 6/13-16/90

2. Narrative of Fire Emergency:

The DOCE FIRE burned over 90% of the 853 acres at an intensity great enough to remove all vegetation from the area which had a stem diameter less then one inch at ground level. The fire started the right-of-way of State Highway 96 [Iron Springs Road], at 5720 feet elevation and travelled quickly to the top of Little Granite Mountain, elevation 7089 feet, and continued north to the base of Granite Mountain near Blair Pass, on Forest Trail 261. The fire was approximately one mile northwest of the Iron Springs homes and one mile west of the Granite Basin summer homes. It burned in chaparral and scattered woodland and ponderosa pine associated with drainages.

The steep slopes and granite soils have a west to southwest aspect. Although previously covered by moderate to dense chaparral, the upper slopes show signs of interill (sheet) erosion , rill, and gully formation. The lower slopes show deposition associated with the chaparral which gives these slopes a terraced look once the vegetation is removed. The burned remnants of plant stems will provide little resistance to soil movement and the terraces will disintegrate with heavy rainfall. Deposits of granite soils which have accumulated in low gradient drainages have cut deeply as a result of the heavy rains which fell in 1970, 1979 and 1983. The removal of vegetation along the drainages will accelerate channel cutting. The soil movement is likely to completely fill existing tanks used for livestock and wildlife water. High water and siltation could affect facilities at the Contreras Ranch 2.5 miles downstream. Soils eroded from the channel north of Little Granite Mountain are likely to contribute sediments to Granite Basin Lake. This lake is to be dredged with State Lake Improvement Funds for greater water capacity which will improve its use for recreation and as a fishery. The site improvement is in its final stages of planning and is to be completed later this year.

With 574 acres of the Granite Mountain Wilderness burned, it is necessary to meet the management objectives for the Wilderness which include not using mechanized equipment within the wilderness and not introducing exotic plant species into the Wilderness during the seeding process. Using hand labor to place native materials in channels within the Wilderness will be the key to reducing water velocities and soil movement. The steep slopes within the Wilderness portion of the burn are very susceptible to erosion. Helicopter seeding of the entire burned area with the native species mixture will be done immediately to take advantage of moisture available during the summer rains.

The 279 acres outside the Wilderness will be seeded with native and non native species with the objective of effective ground cover at the earliest possible time. Soil catchment basins will be placed in channels below the Wilderness boundary [trail # 38], and two stock tanks will be cleaned to reduce sedimentation at the Contreras Ranch.

Forest Trail #38 received some damage from the fire. Several log water bars were burned and need immediate replacement to prevent damage to the trail surface and soil loss from the area.

Two and one half miles of two strand solar powered electric fence will be installed west of Trail #38 and parallel to the western fire edge to protect the reseeded area from grazing for two seasons. The East Unit is now used as winter pasture on the Contreras Allotment. Most of this winter pasture can be used while the newly reseeded area is protected from grazing. Without the electric fence the attraction of the reseeded and sprouting residual vegetation to grazing livestock would cause significant soil and vegetation damage within the burn area.

Emergency Rehabilitation Objectives:

- Reduce sediment movement and in-loading through placement of catch basins and structures in channels on and immediately below the burned area.
- Protect the Contreras Ranch facilities and property from flooding and sediment deposition.
- Reduce the effect of sedimentation on Granite Basin Lake and soil loss from the Granite Mountain Wilderness.
- Promote infiltration of precipitation through seeding and vegetation establishment.
- Implement a closing order to control public access into the burn area and onto Forest Trail # 37, for the protection of new vegetation and exposure of the public to burn area hazards such as loose rock.

DOCE FIRE REHABILITATION PROPOSAL

JUNE 16, 1990

The Burn Rehab Team consisting of Ray Thompson (Leader), Jeff Whitney, Alan Kelso and Karen Groswold reviewed the Doce Fire on June 15 and 16. The field review consisted of riding horseback, flying over and hiking through the area. The burn rehab recommendations are separated for the wilderness and non-wilderness areas of the fire and are following.

Wilderness

- 1. Aerial seed with native grasses/legumes.
- 2. Rock check dams comprising of several rocks laid in the gullies (up to 2 feet deep) to temporarily slow the velocity of the water and allow for the deposition of sediment.

Non-Wilderness

- 1. Aerial seed with non-native and native grasses/legumes.
- 2. Use of rock check dams and logs in the small side gullies (up to 18 inches deep) to retain sediment.
- 3. Use of earthern pit structures in the channels to slow the velocity of water and allow for the deposition of sediment. There are 2.8 miles of channels in the non-wilderness portion of the Doce Fire. Structures using a dozer could be laid in the channel at an interval to allow the velocity of the runoff to be decreased and sediment to accumulate. From the field review, there were 9 channels or groups of channels found within the Doce Fire. These are on the accompanying map and are ranked as to their priority for rehabilitation needs. Each will be discussed seperately following.

Channel group #1

This group of channels is in the most northern portion of the fire and involves both wilderness and non-wilderness areas. This area is of most importance due to the large size of the subwatershed, presence of existing channels and tributaries and, the intensity of the fire. This channel drains to the west and past the Contreras ranch.

Channel group #2

This group of channels involves just non-wilderness. This area is of importance due to the large size of the subwatershed, the intensity of the fire, presence of several large existing channels that have developed in this area. This channel drains to the west down to a stocktank and towards Buckman Flat Spring.

Channel group #3

This group of channels is in the most eastern portion of the fire and involves just wilderness. This area is of importance due to the size of the large subwatershed, the channel development, the location with the Granite Basin Lake subwatershed and the intensity of the fire. There are presently several rather large channels with tributaries that have developed in this area.

Channel #4

This channel is one of several that drains the western side of Little Granite Mountain in the central portion of the fire and involves both wilderness and non-wilderness areas. This area is of importance due to the channel development and the intensity of the fire. This channel also drains west to an stocktank/spring and then past the Contreras ranch.

Channel #5

This channel is one of several that drains the western side of Little Granite Mountain in the central portion of the fire and involves both wilderness and non-wilderness areas. This area is of importance due to the channel development and the intensity of the fire. This channel also drains west to an stocktank.

Channel #6

This channel is one of several that drains the western side of Little Granite Mountain near the southern edge of the fire and involves just non-wilderness. This area is of importance due to the size of the subwatershed, the channel development and the intensity of the fire. This channel also drains west to an stocktank.

Channel #7

These channels are one of several that drains the western side of Little Granite Mountain in the central portion of the fire and involves both wilderness and non-wilderness areas. This area is of importance due to the channel development and the intensity of the fire. This channel also drains west to Division well, Upper Pasture Spring and Contreras Spring.

Channel #8

This channel drains the southern portion of Little Granite Mountain in the southern portion of the fire and involves just non-wilderness area. This area is of importance due to the present channel development and the intensity of the fire. This channel also drains west and passes the Borrow Pit and then to Buckman Flat Spring.

Message:

Status:

PENNY: FOR YOUR INFO - WE ORDERED @7000 LBS OF SEED FROM ARKANSAS VALLEY SEED AND IT WILL BE DELIVERED FRIDAY. WE CAME WAY DOWN ON OUR POUNDS/ACRE TO 8 LBS/ACRE BUT STAYED AT WILDERNESS COST OF \$24.08/ACRE AND NON-WILDERNESS COST OF \$16.32/ACRE. THANKS FOR YOUR HELP IN LOCATING THAT. WE ARE BUSY BUILDING ROCK AND LOG STRUCTURES NOW AND THE DOZER WORK STARTS TOMARROW. BUT - CAN YOU BELIEVE IT RAINED LAST NIGHT "BIG TIME" - HAD 1.6 INCHES AT THE AIRPORT HERE IN TOWN. LOOKS LIKE CLOSE TO THAT OUT ON THE REHAB!! PRAY FOR GENTLE RAIN STARTING FRIDAY!!!!!!
