A.	Burn Severity (acres): 41510 (low) 14218 (moderate	e) <u>1182</u> (high)
В.	Water-Repellent Soil (acres): 0	
C.	Soil Erosion Hazard Rating (acres):	e) <u>4593</u> (high)
D.	Erosion Potential: 3 tons/acre	
E.	Sediment Potential: <u>1785</u> cubic yards / square mile	
	PART IV - HYDROLOGIC DESI	GN FACTORS
A.	Estimated Vegetative Recovery Period, (years):	_4
В.	Design Chance of Success, (percent):	60-90
C.	Equivalent Design Recurrence Interval, (years):	5 & 10
D.	Design Storm Duration, (hours):	24
E.	Design Storm Magnitude, (inches):	0.34 (NOAA Atlas 10yr)
F.	Design Flow, (cubic feet / second/ square mile):	22 (5yr)
G.	Estimated Reduction in Infiltration, (percent):	64
Η.	Adjusted Design Flow, (cfs per square mile):	33 (10yr)
	PART V - SUMMARY OF A	NALYSIS
A.	Describe Critical Values/Resources and Threats:	

Areas of High and Moderate severity with little to no understory vegetation prior to burn adjacent to known noxious weed sites. Most of these areas are on steep slopes; area above and below critical section of Road 46 (primary road) unstable with headcutting potential threatening road. Trails burned in high severity areas with destruction of drainage structures; portions include burning of wood support of treadway (undercut) in wilderness sections adjacent to Panjab Creek.

B. Emergency Treatment Objectives:

Reduction of spread of noxious weeds in areas of high risk. Reduction of erosion and runoff effects in select drainages with at-risk investments, including sections of roads and trails.

C. Probability of Completing Treatment Prior to Damaging Storm or Event:

Land 80 % Channel % Roads/Trails 80 % Protection/Safety %

D. Probability of Treatment Success

	Years	Years after Treatment			
	1	3	5		
Land	70	90	90		
Channel					
Roads/Trails	80	90	90		
Protection/Safety					

E. Cost of No-Action (Including Loss):

F. Cost of Selected Alternative (Including Loss): \$209, 074

G. Skills Represented on Burned-Area Survey Team:

#### H. Treatment Narrative:

(Describe the emergency treatments, where and how they will be applied, and what they are intended to do. This information helps to determine qualifying treatments for the appropriate funding authorities. For seeding treatments, include species, application rates and species selection rationale.)

## **Land Treatments**:

**Aerial seeding** of high severity and adjacent moderate severity areas adjacent or within known noxious weed sites with local native species. Map of treatment sites is included or will be sent seperately. Species mixes and rates included in attachements. Grass establishment will provide enhanced erosion control next growing season and beyond. (Weed treatments is anticipated for next and subsequent years and will be included in an interim request in the next calendar year.)

**Mulching** above and below 46 road section is intended to reduce rate of runoff, stabilize surface and improve erosion resistance, and enhance establishement of stabilizing vegetation.

## **Channel Treatments:**

## Roads and Trail Treatments:

Road segments need drainage improvements, ditch-cleaning, storm-hardening and burned culvert replacement. Trails have burned support in sections; drainage replacement (waterbars) in other sections. Treatments are intended to reduce the risk of fill failure and/or surface loss and resultant deposition in adjacent anadromous fish habitat, including culvert lost to burning (plastic), and provide storm hardening to withstand potential high flows in select areas below high burn severity areas.

## Protection/Safety Treatments:

## I. Monitoring Narrative:

(Describe the monitoring needs, what treatments will be monitored, how they will be monitored, and when monitoring will occur. A detailed monitoring plan must be submitted as a separate document to the Regional BAER coordinator.)

Monitoring of treatment installation and effectiveness is planned; details will be forthcoming in a separate document.
