Emergency Burn Rehabilitation Request,

Fort Robinson Fire

To:

Forest Supervisor, Nebraska National Forest

Your funding request (FS 2500-8) for the Fort Robinson Fire, with a total maximum cost of \$45,250, is approved and enclosed. The work includes seeding 550 acres of critical slopes, placing water diversions on four miles of trails and five miles of non-system or intermittent-service roads for watershed protection, and installing 500 feet of silt fencing along critical stream reaches.

Use the code NFFF - FW22 when spending these funds. Expenditures are not to exceed the amount of authorization. Please provide a final accomplishment report to this office, using the 2500-8, within 30 days of project completion.

You should test your actions against criteria in FSM 2523 and FSH 2509.15 to be sure that all expenditures fully meet the intent of the authorities for use of these emergency funds.

Reply to: 2520 Emergency Fire Rehabilitation

Date: JUL 21 1009

Subject: Fort Robinson Fire, Nebraska

To: Forest Supervisor, Nebraska National Forest

On July 11 through 14, 1989 Malcolm Edwards and Marc Wilcox (Regional Fire Rehabilitation Team) were requested to look at the Fort Robinson Fire on the Nebraska National Forest for possible post-fire rehabilitation measures. The Fort Robinson Fire burned approximately 9600 acres on NFS (Soldier Creek Mgt. Unit), 16,000 acres on State lands (State Park) and 22,900 acres private lands for a total of 48,500 acres perimeter (refer to enclosed map).

Wednesday, July 12, we met with representatives from various local agencies (see enclosed name list) at the Supervisor's Office in Chadron, NE. This morning meeting was spent discussing: (1) mission of the FS Rehabilitation Team, (2) local level co-ordination with private landowners and agencies, (3) State Park concerns, such as the Park being a high level visitor-use attraction and degradation of visual and stream quality. The remainder of the day, the group proceeded to the burn area outside of Crawford, NE, to look at burn intensities and possible impacts that could occur downstream both within NFS and State lands. We also looked at the stream (Soldier Cr.) and the Game & Parks Department ponds and Johnson Lake, which all could be impacted by increased sediment and ash from the fire. It was determined that no more than 15% of the fire perimeter had burned at a high intensity which would lead to "water repellant" watersheds, based on a sampling of soil surfaces and visual verification. Other areas (such as private lands) were also visited to determine the extent and burn damage of the area as a whole.

On Thursday morning (0600), John Williams (NRD), Craig Derickson (SCS) and Malcolm Edwards (FS) flew the fire area for 1.5 hours to map out the light, moderate and intense burn areas and the critical watersheds within the perimeter. The vast majority of the burn had a blackened appearance with a high percentage (40% + tree kill) of Ponderosa pine. The blackened appearance on the ground indicates a light to moderate burn intensity, with some grass and shrub roots remaining viable to sprout next year. Critical watersheds were noted along Soldier Creek and other lands (State & Private).

Following the gathering of field data, Edwards & Wilcox (with assistance from C. Derickson of the SCS) established recommendations in the FS form 2500-8 for submittal to the Regional Office. Approximately 550 critical watershed acres are recommended for seeding on NFS lands, 435 acres on State Park lands and 825 on private. Other items such as silt fencing, gully control, road obliteration and trails stabilization are covered within the FS-2500-8. Emergency Rehabilitation funds are applied for only on NFS lands; however, other lands are included on the form to document needs by the other respective agencies, by request, due to the fact that not all of the expertise needed by them was available from their agencies at the time.

Costs per acre of aerial seeding were estimated at \$50.00. Recommended seed mix for NFS (and other) lands is:

Species	1b./acre
Western Wheatgrass	10
Cereal (Annual) Rye	3
total	13

(This seed mix is to be applied before the first major damage producing storm).

The preferred alternative, developed by the Rehabilitation Team and selected by the Forest and local Agency Team is summarized as follows:

Emergency Project	NFS	State	Private
Seeding	550 ac.	435 ac.	825 ac.
Silt fencing	500 ft.	800 ft.	?
Trail rehabilitation	4 mi.	0	0
Road oblit./rehab.	5 mi.	20 mi.	. 0
Gully control	0	25 units	0

The silt fencing will be done immediately adjacent to The Game & Parks ponds on FS lands, and Carter Lake (State). Trail and road rehabilitation (and obliteration) will be done to reduce overall sediment load from the area, especially on the lower 1/3 of the critical slopes identified. Gully control is a recommended measure in Smiley Canyon of the State Park, adjacent to the highway in the burn area. Projects on other than NFS lands will be funded by the appropriate local agencies and/or local landowners, co-ordinated by the NRD and SCS. Locations of each rehabilitation measure are marked on 1:24,000 topo maps, which were left in the charge of the Nebraska NF. Other long term measures were identified by the Forest and Agency team.

D. Remarks

In part VI. State lands consist of Fort Robinson State Park: Private lands are those surrounding the NFS and State lands within the fire perimeter. These are funded from other sources than Emergency Rehab 2500-8.

(#proposed seed mix: 10 lb. western wheatgrass, 3 lb. cereal (annual) rye total per acre (13 lb./Acre))
Road obliteration in section VI: These roads are very primitive and within a wilderenss area; they were used administratively during the fire and are adjacent to a perennial stream (Middle Fork Soldier Creek); Obliteration is designed to reduce overall sediment load in the burn area, as well as disperse instead of concentrate runoff that is excessive to normal amounts expected before the fire. (refer to 2520 narrative of 18 July, 89)
