Subject:

Horse Creek Emergency Burn Rehabilitation Request

To:

Forest Supervisor, Black Hills National Forest

I have reviewed your request for Emergency Burn Rehabilitation funds for the Horse Creek incident. Your request is approved in the amount of \$18,750 for seeding, additional road maintenance needs, and ID Team cost.

Emergency Burn Funds have strict requirements as defined in FSH 2509.13. Please use code FFFS-FW22 when expending these funds. A final accomplishment report is required on Form FS-2500-8 thirty (30) days after completing rehabilitation measures.

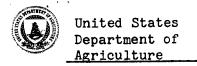

GARY E. CARGILL Regional Forester

HORSE CREEK FIRE BLACK HILLS NATIONAL FOREST

I. LOCATION OF FIRE (see attached map)

The fire was located in:

T1N, R5E: Sections 20, 21, 22, 23, 26, 27, 28, 34 & 35

II. CAUSE OF FIRE

The fire started on Friday April 5, 1991 when unexpected strong winds rekindled the Horse Creek prescribed burn. The prescribed burn had been safely completed the day before with crews spending the night on the fire.

III.DESCRIPTION OF AREA

The area is characterized by moderately sloping to very steep timbered sideslopes, interspersed with grassy meadows, small aspen stands, and rock outcrops. Dissection is strong. Precambrian slate and schist are the dominant geologic features. Dominant soils are Virkula and Pactola. Ponderosa pine is the dominant timber type. Typical understory species include big and little bluestem, pin cherry, chokecherry, and kinnikinnick.

The fire area is designated as Management Areas 2B, 5B and 6B in the Black Hills Forest Plan. 2B management emphasis is on roaded-natural recreation opportunities; 5B management emphasis is on wildlife winter range in forested areas; and 6B management emphasis is on livestock grazing on mountain and prairie grasslands.

IV. SIZE OF BURNED AREA

The fire burned a total of 1355 acres, approximately 1155 acres of National Forest System lands and 200 acres of private lands.

V. EXTENT OF RESOURCE DAMAGE

High intensity burns (area completely blackened, with all foliage removed from the trees) occurred on approximately 570 acres of National Forest System lands. Most of the high intensity burns occurred near the drainage heads including the hilltops and connecting ridgelines. On the remaining National Forest System lands, 140 acres received moderate intensity burns (understory burned, and some discoloration and loss of overstory foliage), and approximately 445 acres received low intensity burns (only understory vegetation burned). The private land received low intensity burns.

No structures were lost in the fire. Structural engines and "back burning" were used to protect homes and buildings in the area. There were about 140 private homes in the vicinity of the fire. The fire burned past 7 structures but all of them were saved.

Several miles of highway R-O-W fence, private land fence, and range allotment pasture fences were burned or damaged and will require repair or replacement.

VI. AFFECTED RESOURCES

The area has undergone changes affecting many other resources. Visual quality and esthetics are a major concern, especially along heavily travelled US Highway 385. Over 1.2 million people travel US 385 on an annual basis. Scenic quality and tourism may be impacted for several years to come.

The burned area is visible from two major recreation complexes, Pactola Reservoir located two miles to the north and Sheridan Lake located 3 miles to the south. Developments at these areas include campgrounds, picnic areas, boat launches, marinas and swimming beaches. About 50,000 people visit the Pactola Visitor Center at Pactola Reservoir during the summer months.

The area supports a small band of elk, several hundred head of deer and wild turkey. There will be few, if any, adverse effects on these species in the short-term. Due to the time of the year when the fire occurred, green-up is expected to be rapid and result in improved forage conditions within meadows and grassland areas. Long-term management of this area will have to address the availability and distribution of cover to insure that this improved forage base can be used effectively by elk and deer.

The short term loss of ground cover will reduce nesting habitat availability for wild turkey, sharp-tailed grouse and other early season ground nesting birds during the current year. Natural regeneration and rehabilitation efforts will offset this loss within a few growing seasons. The loss of ground cover also makes this area vulnerable to infestation by noxious weeds, especially Canada Thistle. Within the Black Hills, Canada Thistle is an aggressive invader that readily colonizes areas of bare or exposed soil. Control measures taken after Canada Thistle becomes established are expensive and show little effect beyond controlling the rate of spread. Eradication on a particular site is seldom achieved. Aggressive management to restore desirable vegetation on disturbed sites is showing promise at reducing the number of new Canada Thistle infestations.

Potential soil loss from erosion will affect the area's ability to regenerate and eventually produce timber again. The area is characterized by relatively thin soils, making any soil loss a potentially severe problem. Runoff from the southern half of the fire area contributes flow to Horse Creek, a tributary to Sheridan Lake which is a high value fishing lake. The South Dakota Department of Water and Natural Resources has expressed interest in dredging Sheridan Lake to improve boating opportunities and lengthen the life of the lake. Increased sedimentation via Horse Creek will have a negative impact on Sheridan Lake.

VII.REHABILITATION STRATEGY

The proposed rehabilitation strategy includes seeding 570 acres of National Forest System lands that received high intensity burns. The steep to very steep sideslopes have little or no effective ground cover remaining to reduce or prevent soil erosion. The high intensity burned areas have no needles left on the blackened pines, consequently there will be no needle cast to provide ground cover.

The proposed rehabilitation seeding mixture is presented below.

Annual Ryegrass 5 pounds/acre (PLS)
Slender Wheatgrass 5 pounds/acre (PLS)
Timothy 3 pounds/acre (PLS)
Alsike Clover 3 pounds/acre (PLS)

Total 16 pounds/acre (PLS)

Aerial seeding with a helicopter is planned and included in the seeding costs presented in the report.

In addition to the soil, water and fishery protection efforts described above, the Rehabilitation Plan includes funding for additional road maintenance on 5.7 miles of system roads. It is expected that sediment from burned areas will increase road maintenance needs and frequencies, and that some culverts will need to be replaced.
